

ThorneVet – Longevity Complex Is Replacing Small Animal Antioxidant

We want to let our faithful Small Animal Antioxidant customers know that after significant research and much consideration, ThorneVet will replace this mainstay formula with our new Longevity Complex. In our constant quest to provide the most bioavailable and therapeutic animal health products on the market, we are confident the synergistic combination of the nutrients in ThorneVet's new Longevity Complex surpasses the antioxidant potential of Small Animal Antioxidant and will excel at supporting the healthy aging and longevity of companion animals.

We have increased the quantity of the potent combination of polyphenol compounds – trans-resveratrol, curcumin and quercetin – by 2-3 times the amount of what is in Small Animal Antioxidant. In addition, we bypassed the limitations of bioavailability and cost of several other ingredients in Small Animal Antioxidant, by replacing them with Indena's Green Tea Phytosome – thus providing a potent combination of bioavailable green tea catechins – and with AstaReal's Astaxanthin – a potent ketocarotenoid with an antioxidant potential 10 times that of beta carotene and 100 times that of alpha-tocopherol (Vitamin E).

When you combine the potent antioxidant effect of the polyphenol compounds in Longevity Complex with the anti-aging and longevity-promoting ingredients of nicotinamide riboside hydrogen malate and taurine, this innovative formulation takes immune support and protection to a higher level.

Pet parents, we encourage you to consider the health and longevity benefits of giving this new ThorneVet supplement to the companion animal you love and cherish. Veterinarians, we encourage you to add Longevity Complex to your formulary for the many indications of use that you will be able to use it for.
